Name	MyTherapy	ONCOassist	Google Calendar	OncoCalm
Platform	Google Play (Android) and App Store (iOS)	Google Play (Android) and App Store (iOS)	Google Play (Android) and App Store (iOS)	Google Play (Android) and App Store (iOS)
Analized version	3.266.1	9.27.2	2026.17.0-909654459-release	TBD
Analysis Date	May 12th, 2026	May 14th, 2026	May 15th, 2026	May 15th, 2026
Link	https://www.mytherapyapp.com/es	https://oncoassist.com/	https://workspace.google.com/intl/es-419/products/calendar/	TBD
Target user profile	Patient and caregiver, both need to remember, monitor, and record medication intake and the onset of symptoms.	Healthcare professionals in the field of oncology, who seek reliable resources to guide the treatments of their patients.	Various user profiles, mainly those who need to record events and reminders.	Patients undergoing cancer treatment, their responsible caregivers, and the oncology medical team.
Value proposition	MyTherapy is your personal, digital health companion. Reliable medication reminders and consistent documentation of your intakes.	The free go-to app for Oncology Professionals.	Make the most of your day with easy event creation, multiple calendars, customizable views, widgets, tasks, and more.	OncoCalm is an app focused on creating a connection between you, your caregiver, and your doctor during cancer treatment. Set reminders and records for your medication intake and symptoms, organize appointments, get precise information about your treatment, and easily share it with the medical team. All of this can be synced with your caregiver, so you don't feel alone during this challenging process.
Main features	Medication reminders, symptom and mood diary, creation of multiple profiles for different treatments, and generation of reports for the medical team.	Adjuvant tools, interactive formulas, prognostic scores, drugs information and interaction.	Creation of events, tasks, reminders, multiple views (day, month, agenda), and push notifications.	Reminders and monitoring of medication intake and symptoms, connection between patient user and caregiver user, recording of medical hours, convenient reading of recorded data for the medical team, availability of information on various aspects of cancer treatment (diagnosis, medications, side effects, contraindications).
Onboarding flow	First, the app asks for profile information such as name, sex, and year of birth, and a notification tone is set for the user. Next, the app allows the user to setup a routine by selecting the medication, the person who will take it, the frequency, and the times for taking it. Finally, the app asks for the current amount of medication on hand to determine when to restock, as well as the reason for taking it.	The application does not have an onboarding flow, only create an account. Users are initially asked for personal information such as their name and email address. Next, they are asked for their profession and a description of their work, what types of cancer they treat, and which ones they treat most frequently. Finally, they are asked to accept the terms and policies, to provide notifications, and to save their data.	The application does not have an onboarding system, as it relies on being intuitive.	The first page allows choosign between the user profile or medical team profile.
Navigation patterns	<i>Bottom nav.</i> : It uses the navigation bar at the bottom of the screen to move between the screens: Today, Progress, Support, and Therapy. <i>Navigation depth</i> : An average of 3 layers for everyday tasks, and for configuration tasks (like adding a medicine) 7 layers.	<i>Bottom nav</i> : It uses a navigation bar at the bottom of the screen, which allows to switch between Home, Favorites, and Notifications. <i>Home Widgets</i> : The Home page contains various widgets such as: Formulas, ONCOvideos, ONCONews, Drug Info & Interaction, among others. <i>Navigation depth</i> : An average of 6 levels	<i>Gestures</i> : It uses gestures to move between the calendar and weeks, as well as to increase or decrease the size of events. <i>Side bar</i> : It uses a sidebar that displays the different calendars, the different types of event visualizations, and the settings and help at the bottom. <i>Navigation depth</i> : For event tasks, around 2 levels, for settings, around 4 or 5 levels.	<i>Botton nav.</i> : It use the navigation bar at the bottom to move between the screens: Home, Schedule, Record, Help, and Profile. <i>Voice assistant</i> : It uses a voice search assistant to find sections of the application.
Visual desing and consistency	Color scheme is predominantly red and white (or dark grays in dark mode) with light purple accents for details. Sans-serif type of fonts. The iconography is simple, with simplified drawings for profile portraits. During the onboarding process, information is centered to avoid excessive white space in any area of the screen, but throughout the rest of the application, information is concentrated at the top. Therefore, if there is not a lot of information, there is white space between the information and the navigation bar. There is a high internal consistency in the design.	White and sky blue predominate in the color palette, the latter used for details. It does not have a dark mode. The typography is Sans-serif type. The iconography is simple, but the icon design is inconsistent. Onboarding information is vertically centered, but horizontally everything is closer to the top. There is moderate inconsistency in the design, because messages like "Updated" can be found in different shades of blue between screens.	The design is predominantly white, with accents in blue and light blue. It features a dark mode, in which the details change to a lighter shade of light blue. The typography is Google Sans, which is a Sans-serif type. The iconography is simple and self-explanatory. It includes a pseudo top bar, which displays the month and days of the week, though this may vary depending on the selected view. Information is organized below the top bar, allowing users to scroll to view different events. The design maintains a high degree of consistency.	Color scheme of blue, light blue, and white, reminiscent of colors used in the medical field, with details emphasized in light purple to convey a sense of calm and tranquility. Sans-serif typography. Simple iconography of line icons.
Visible accessibility	Legible font size, contrast that allows recognition of key features, labels on navigation icons, available dark mode, big size for important touch elements like confirmations, descriptions of features available on certain key screens, chatbot support.	Font size difficult to read, contrast that allows recognition of key functionalities, labels on navigation bar icons, no voice search, no dark mode, descriptions of different tools are available.	Legible font size, contrast that allows recognition of key functionalities, use of labels in the icons of the sidebar, supports voice control, dark mode available, big size for important touch elements, chatbot support by Google Assistant.	Large and legible font size, contrast with accent color for key features and selected buttons, labels on navigation bar icons, voice search for features, dark mode available, touch elements are big so they have a considerable margin of error, especially for elderly people.
Remarkable aspects	1. "Streak" system: An incentive to maintain consistent medication intake. 2. Indication of who the treatment is for: A clear indication to identify whether the reminder or record is for the user or another profile.	1. Extensive data related to oncology tools and medications. 2. Medical calculators for dosages or calculating scores on oncology scales.	1. Intuitive interface by using gestures and simple icons. 2. Easy reading of the different scheduled events. 3. Ability to share events.	1. Synchronization between the patient and the caregiver profiles through the app. 2. Association with medical team with a specialized interface.
Aspects that can be improved	1. Unclear symptom rating system: Since it relates to a scale used in a medical context, it fails to meet Nielsens heuristics regarding consistency and standards. 2. Partial functionality without an internet connection: Some tools like adding a medication routine or the chatbot do not work offline, and it does not notify users that an internet connection is required, failing to meet the Niesens heristics regarding recognition, diagnosis, and recovery from errors. 3. Use of ads as a source of revenue: the app targets older adults, and ads are difficult to dismiss, interrupting the flow state of the user at adding friction at the process.	1. The functionality is not very intuitive; to delete favorites, you have to delete them from within, this does not apply Jakobs Law. 2. Large number of options on main page, its associated to the Choice Overload law.	1. Lack of an onboarding system to learn how the app works, failing the Nielsen heuristic about help and documentation. 2. Certain settings can be hidden in too many steps, causing the user to forget where they are by the Miller's Law	1. Limited onboarding (only 1 step), which fails the Nielsen heuristic of help and documentation. 2. Lack of "undo action" options, failing the Nielsen heuristic about user control and freedom.
Domain dimentions				
Data export	It allows to export the recorded data as PDF, one month at a time.	It does not allow exporting data.	Event data can be synced with other platforms like Apple Calendar or Samsung Calendar, but not specifically export.	It allows exporting the recorded data via QR code for the medical team, and connects the application with another user via invitation link.
Offline functionality	Partial functionality: some features (for example, adding a medication) require an internet connection, yet the system does not inform users about this.	It allows offline operation, but reducing functions.	It allows you to view all events and add new ones.	All features are available, except for real-time notification between users.
Language used	User-friendly language.	Professional and formal language, using technical language about oncology in most of the app.	Neutral language, not too friendly and not too formal.	User-friendly language.
